

ABSTRACT

A connector is provided which includes a body with a conduit therethrough and a protrusion extending from the body. The body has a first end, a second end, an inner surface and an outer surface. The protrusion desirably extends from the outer surface of the body and is desirably configured to be received in a second member so as to allow the connector and the second member to be releasably interconnected. Although a connector in accordance with the present invention may be used with feeding sets, enteral feeding tubes and the like, its use is not limited thereto, nor is its use limited to use in the medical arts.
